DISCLAIMER

This manual describes proper installation procedures and provides necessary standards required for product reliability. Warranty details are available on website. All installers must thoroughly read this manual and have a clear understanding of the installation procedures prior to installation. Any installation or use of this product not in accord with or not authorized by this written instruction shall void any and all warranties, express or implied, on the product or the use of the product and may cause failure, property damage and personal injury. IronRidge is not liable for any unauthorized use. Install and use only with other IronRidge products to ensure proper fit and function.

IT IS THE INSTALLER'S RESPONSIBILITY TO:

- Ensure safe installation of all electrical aspects of the array. All electrical installation and procedures should be conducted by a licensed and bonded electrician or solar contractor. Routine maintenance of a module or panel shall not involve breaking or disturbing the bonding path of the system. All work must comply with national, state and local installation procedures, product and safety standards.
- Comply with all applicable local or national building and fire codes, including any that may supersede this manual.
- Ensure all products are appropriate for the installation, environment, and array under the site's loading conditions.
- Use only IronRidge parts or parts recommended by IronRidge; substituting parts may void any applicable warranty.
- Review the Design Assistant and Certification Letters to confirm design specifications.
- Ensure provided information is accurate. Issues resulting from inaccurate information are the installer's responsibility.
- Validate foundation parameters prior to installation, as a local geotechnical report may be required to assess ground conditions. We recommend consulting with a local engineer familiar with local regulations and build site requirements, including soil conditions, terrain and load criteria. All parameters may impact foundation requirements.
- Ensure bare copper grounding wire does not contact aluminum and zinc-plated steel components, to prevent risk of galvanic corrosion.
- If loose components or loose fasteners are found during periodic inspection, re-tighten immediately. Any components showing signs of corrosion or damage that compromise safety shall be replaced immediately.
- Provide an appropriate method of direct-to-earth grounding according to the latest edition of the National Electrical Code, including NEC 250: Grounding and Bonding, and NEC 690: Solar Photovoltaic Systems.
- Disconnect AC power before servicing or removing modules, AC modules, microinverters and power optimizers.
- Review module manufacturer's documentation for compatibility and compliance with warranty terms and conditions.

1. BUILD BASE

A. MARK LOCATIONS

Establish pier locations. Once grid of pier locations has been set, verify all angles are square.

➢ **Spacing varies with load conditions. Consult engineering specs.**

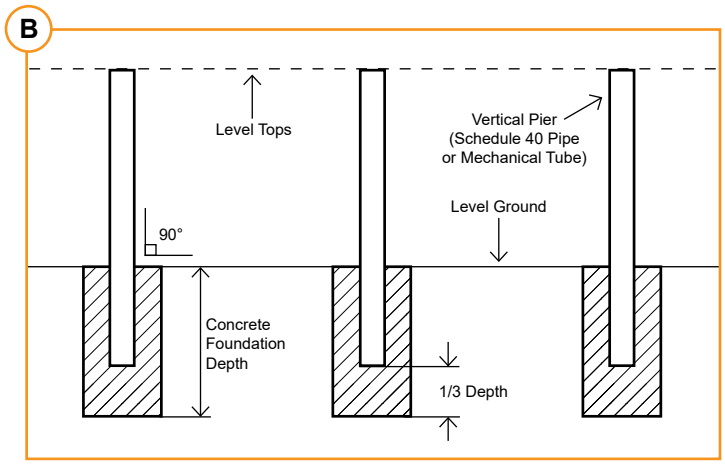

B. POSITION PIERS CONCRETE FOUNDATIONS

Excavate the foundation holes. Insert vertical piers into foundation holes, and pour in concrete mixture. Ensure vertical piers are plumb, level, square, and placed in parallel rows. Level the tops so they are even.

➢ **Brace piers until concrete foundation has cured.**

➢ **In some cases, cross bracing is required to provide extra support for piers. If required, install Diagonal Braces at this time.**

1. BUILD BASE (CONT.)

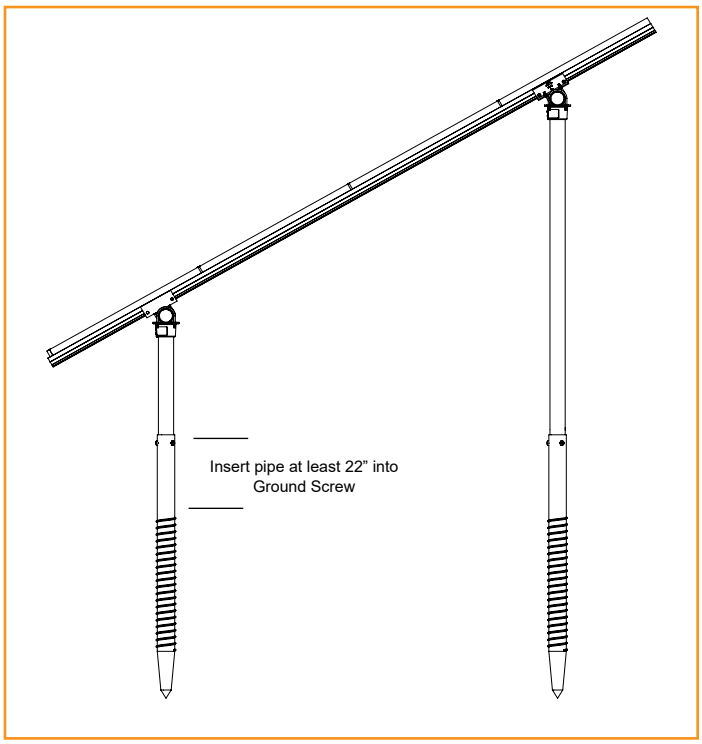

GROUND SCREW FOUNDATIONS

Follow respective Ground Screw Manufacturer's installation methods for driving screws into soil. Insert vertical piers into ground screws, ensuring at least 22" of pier is inserted into ground screw.

	Mech. Tubing: 75 ft-lb	Mech. Tubing: 90 ft-lb

- **A minimum ground screw length of 1300mm must be used for either ground screw manufacturer. Longer lengths may be required in areas with high wind and snow loads or risk of freeze-thaw heaving. Check with your local jurisdiction for frost line embedment requirements.**
- **Hex Head Set Screw must be M16-2.0 x 40mm hot-dip galvanized bolts.**

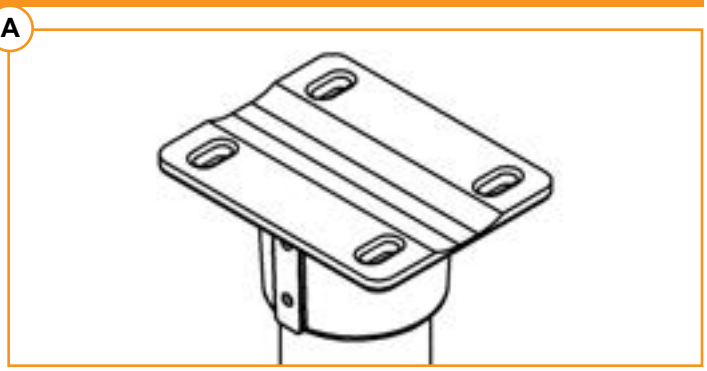

2. CONNECT SUBSTRUCTURE

A. MOUNT TOP CAPS

Mount a Top Cap on each vertical pier. Wait to tighten set screws.

- **If using Diagonal Braces, install them prior to Top Caps.**
- **Do not install Top Caps on threaded pipe ends.**

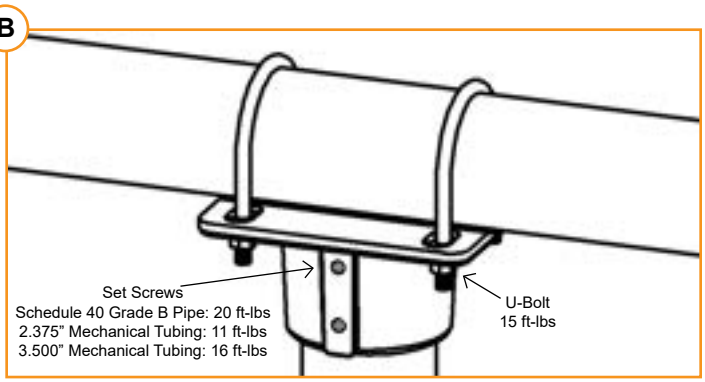

B. LAY HORIZONTAL BEAMS

Set horizontal beams(Pipe or Mechanical Tubing) in Top Cap grooves. Attach with 3/8" U-bolts, Flange Nuts, Flat Washers and Lock Washers. Alternate each side when tightening to avoid warping U-bolts. Torque U-bolts to **15 ft-lbs** and align assembly.

Torque Top Cap set screws to **20 ft-lbs** for Schedule 40 Grade B Pipe, **11 ft-lbs** for 2.375" x 12 ga Mechanical Tubing, and **16 ft-lbs** for 3.500" x 8 ga Mechanical Tubing.

- **To join more than one section of horizontal beams, see Page 10.**
- **Ensure both U-bolts are installed on every Top Cap.**

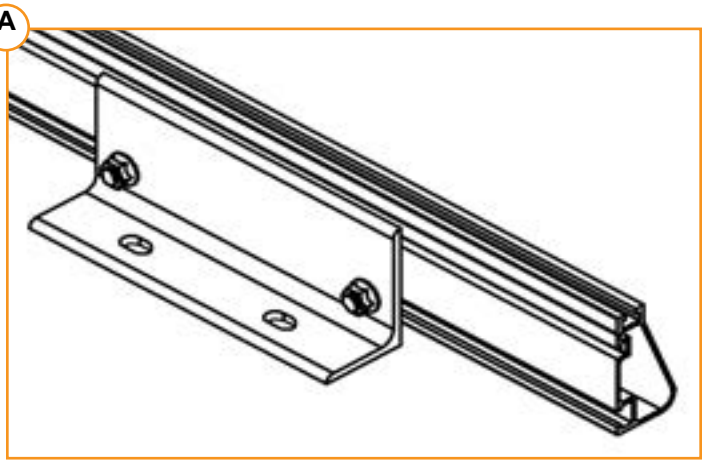

3. PLACE RAILS

A. ATTACH HARDWARE

On the ground, attach Rail Connector brackets to rail by sliding 3/8” bonding bolts into side slot. Space out to match vertical pier spacing. With brackets in place, finger tighten Flange Nuts onto bolts.

- **Tape ends of rail, to keep bolts from sliding out while moving.**
- **Rail Connector should be located at least flush with pipe end.**

A

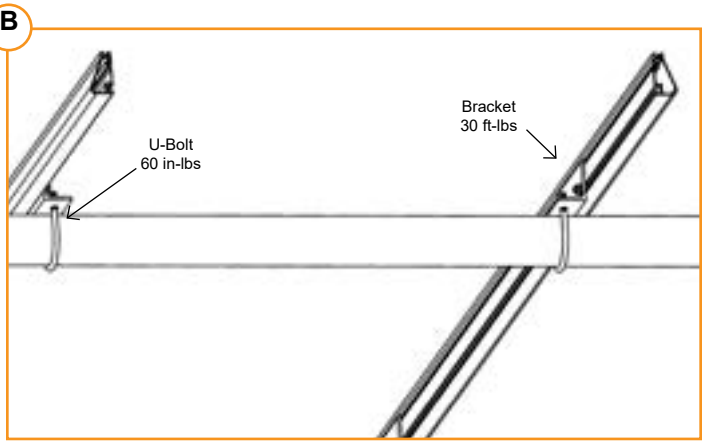

B. FASTEN CONNECTORS

Center Rails on horizontal beams, leaving equal distance on ends. Secure with Rail Connector hardware: 3/8”-16 U-bolts, Flange Nuts, Flat Washers and Lock Washers. Alternate each side when tightening to avoid warping U-bolts. Torque U-bolt nuts to **60 in-lbs** and bracket to **30 ft-lbs**.

- **Spacing between rails should align with module manufacturer**

B

4. SECURE LUGS

Grounding Lugs

Only one Grounding Lug (Rail or Module) required per continuous subarray, regardless of subarray size (Unless frameless modules are used, see Page 13).

- **Grounding Lugs are intended to for use with one solid or stranded copper wire, conductor size 14-4 AWG.**

Rail Grounding Lug

Insert T-bolt in Top Rail slot and torque Hex Nut to **80 in-lbs**. Install a minimum 14 AWG solid copper or stranded grounding wire. Torque terminal screw to **20 in-lbs**.

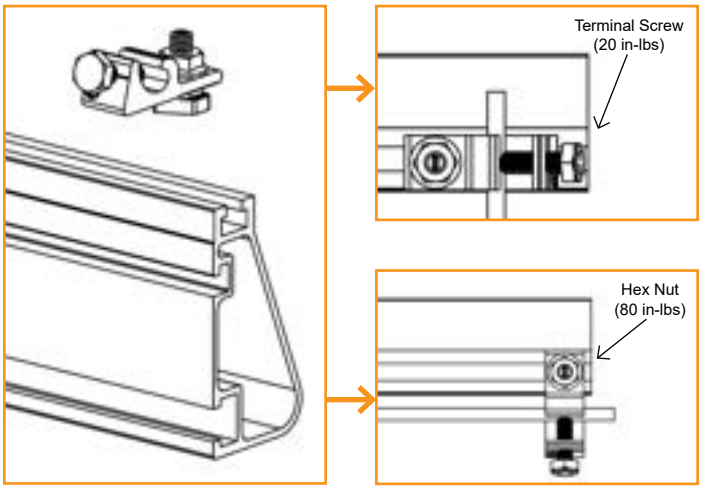

- **Rail Grounding Lugs can be installed anywhere along the Rail and in either orientation shown.**

Module Grounding Lug

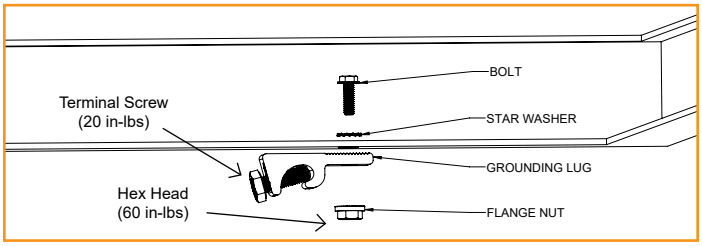

Insert Bolt through Module Manufacturer approved grounding location and torque Hex nut to **60 in-lbs.** One Module Grounding Lug may be installed to one module per continious array. Install a minimum 14 AWG solid copper or stranded grounding wire. Torque terminal screw to **20 in-lbs**.

- **Refer to module manufacturer manual for grounding instructions.**

5. SECURE MODULES

A. SECURE FIRST END

Place first module in position on rails, a minimum of 1" from rail ends. Snap Stopper Sleeves onto UFO. Fasten module to rail using the UFO or EFO, ensuring that the clamp is hooked over the top of the module. Torque to **80 in-lbs**.

- **Ensure rails are square before placing modules.**
- **Hold Stopper Sleeves or EFO on end while torquing to prevent rotation.**
- **If using CAMO instead of UFO + Stopper Sleeve, refer to Page 7 for CAMO installation procedure.**
- **UFO can be installed on modules 30 to 46mm.**
- **EFO can be installed on modules 30 to 40mm.**

B. SECURE NEXT MODULES

Place UFO into each rail, placing them flush against first module. Slide second module against UFO. Torque to **80 in-lbs**. Repeat for each following module.

- **When reinstalling UFO, move modules a minimum of 1/16" so UFOs are in contact with a new section of module frame.**
- **When UFOs are loosened and re-tightened, ensure UFO T-bolt bottoms out in rail channel before re-torquing UFO to achieve full engagement between T-bolt and rail.**
- **If using Wire Clips, refer to Page 9.**

C. SECURE LAST END

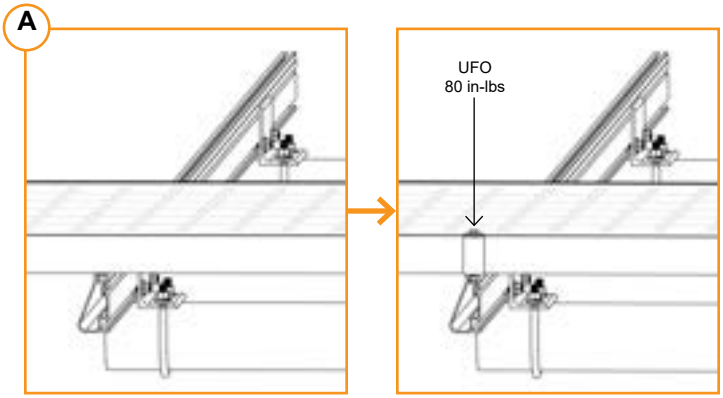

Place last module in position on rails, a minimum of 1" from rail ends. Snap Stopper Sleeves onto UFO. Secure UFO or EFO Clamps on rails, ensuring they are hooked over top of module. Torque to **80 in-lbs**.

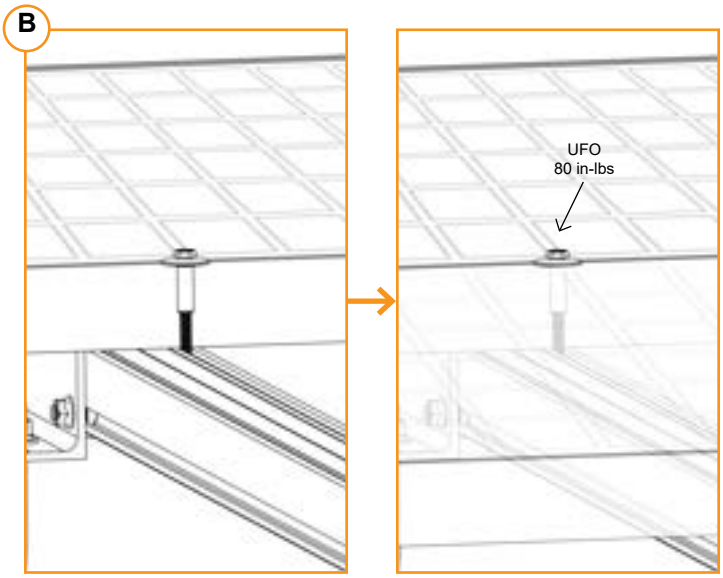

- **Hold Stopper Sleeves or EFO on end while torquing to prevent rotation.**
- **If using CAMO instead of UFO + Stopper Sleeve, refer to Page 7 for CAMO installation procedure.**

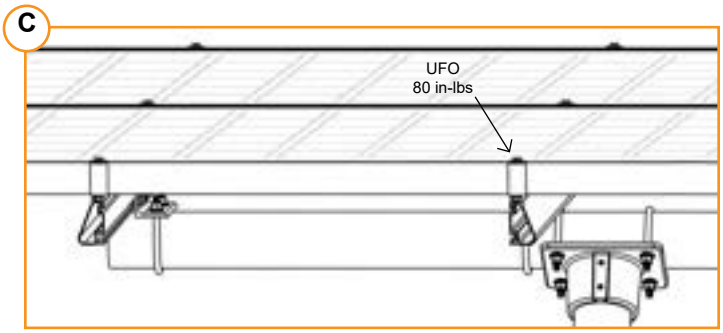

D. REPEAT STEPS

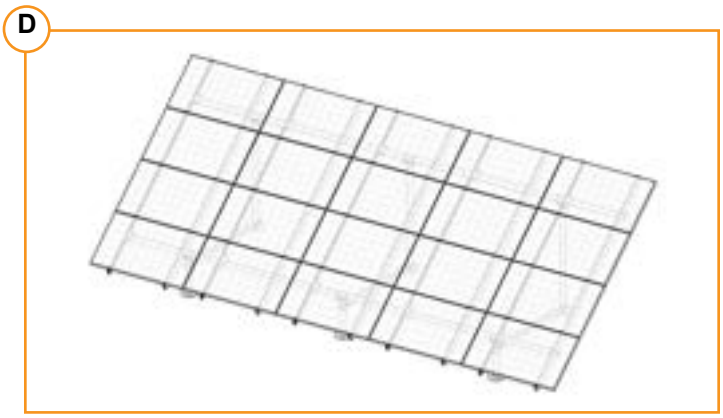

Secure remaining module rows, leaving a minimum 3/8" gap between rows.

- **If using End Caps, refer to Page 9.**

A. SLIDE INTO RAIL

Slide CAMO into rail channel far enough to clear the module frame. CAMO requires 6" of clearance from end of rail.

A

B. PLACE MODULE

Place module on rails (module cells not shown for clarity). When installing CAMO the module can overhang the rail no more than 1/4".

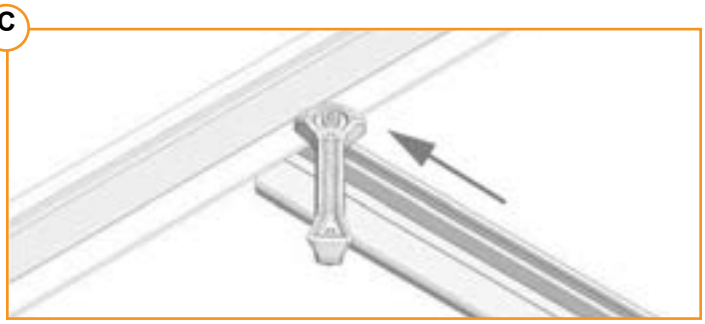

B

C. PULL TOWARDS END

Pull CAMO towards rail ends, at 45 degree angle, so the bonding bolt contacts the module flange edge.

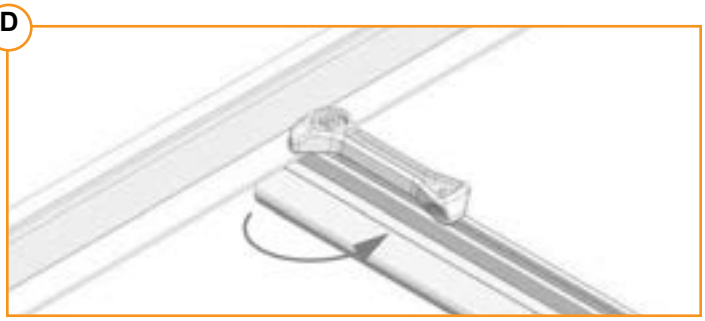

C

D. SECURE TO FRAME

Rotate handle with an upwards motion until CAMO snaps into rail channel. Ensure CAMO bonding pins are fully seated on top of module frame.

D

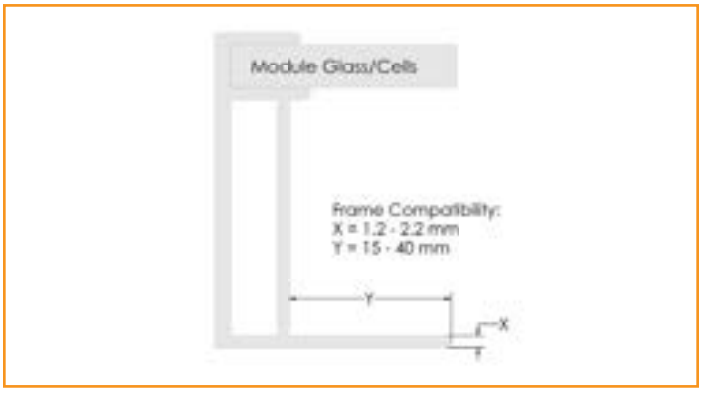

- ***CAMO is not intended for installation on any island or within 3 miles from any coastline and 2 miles from saltwater bays and inlets. CAMOs installed in these regions will not be covered by the IronRidge Product Warranty.**

  Refer to IronRidge Design Assistant for installation applicability

FRAME COMPATIBILITY

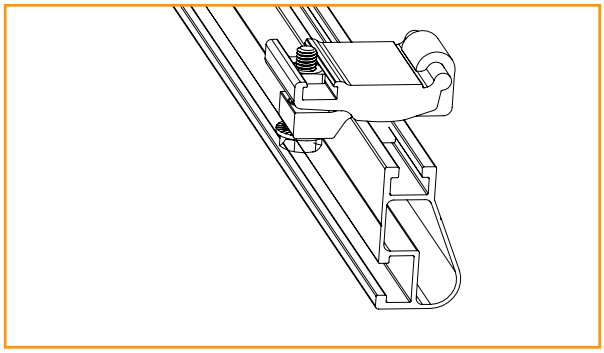

CAMO has been tested or evaluated with all modules listed in the Module Compatibility section having frames within the referenced dimensions. Be sure the specific module being used meets the dimension requirements.

- **For installations with Hanwha Q CELLS modules with 32 mm frame heights, the maximum ground snow is 45 PSF (33 PSF module pressure).**
- **CAMO is only compatible with Canadian Solar modules CS1YxxxMS, CS3N-xxxMS, CS6R-xxxMS-HL and CS6W-xxxxMB-AG. "xxx" refers to the module power rating.**

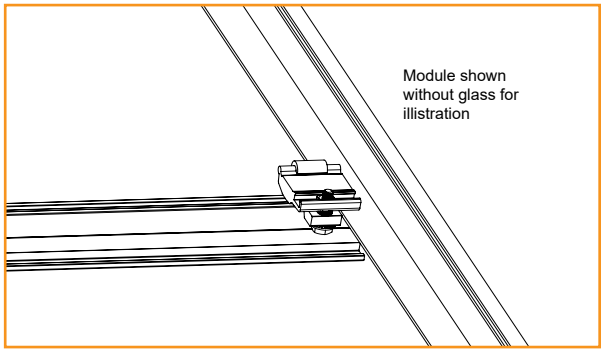

A) Align Eclipse and slide into the top channel of the XR Rail far enough to clear the module frame.

- Note the head of the bolt should be facing towards the roof.
- It's easiest to orient the Eclipse so that the head of the bolt is on the flat side of the rail.

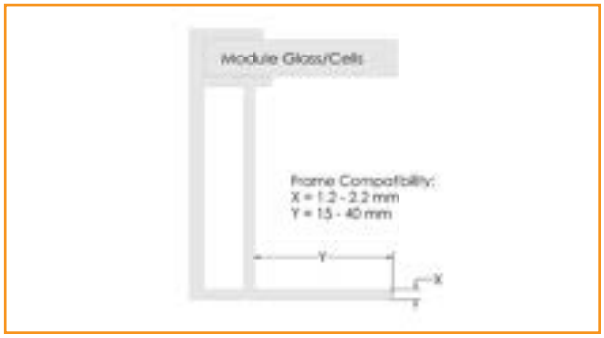

B) Place module on rails, then pull the Eclipse towards the module frame so the upper part of the Eclipse is resting on the module flange

- Because of XR's triangular profile, if the Eclipse is oriented so the head of the bolt is on the angled side, a crescent wrench will most likely be needed to tighten the clamp and secure the module.

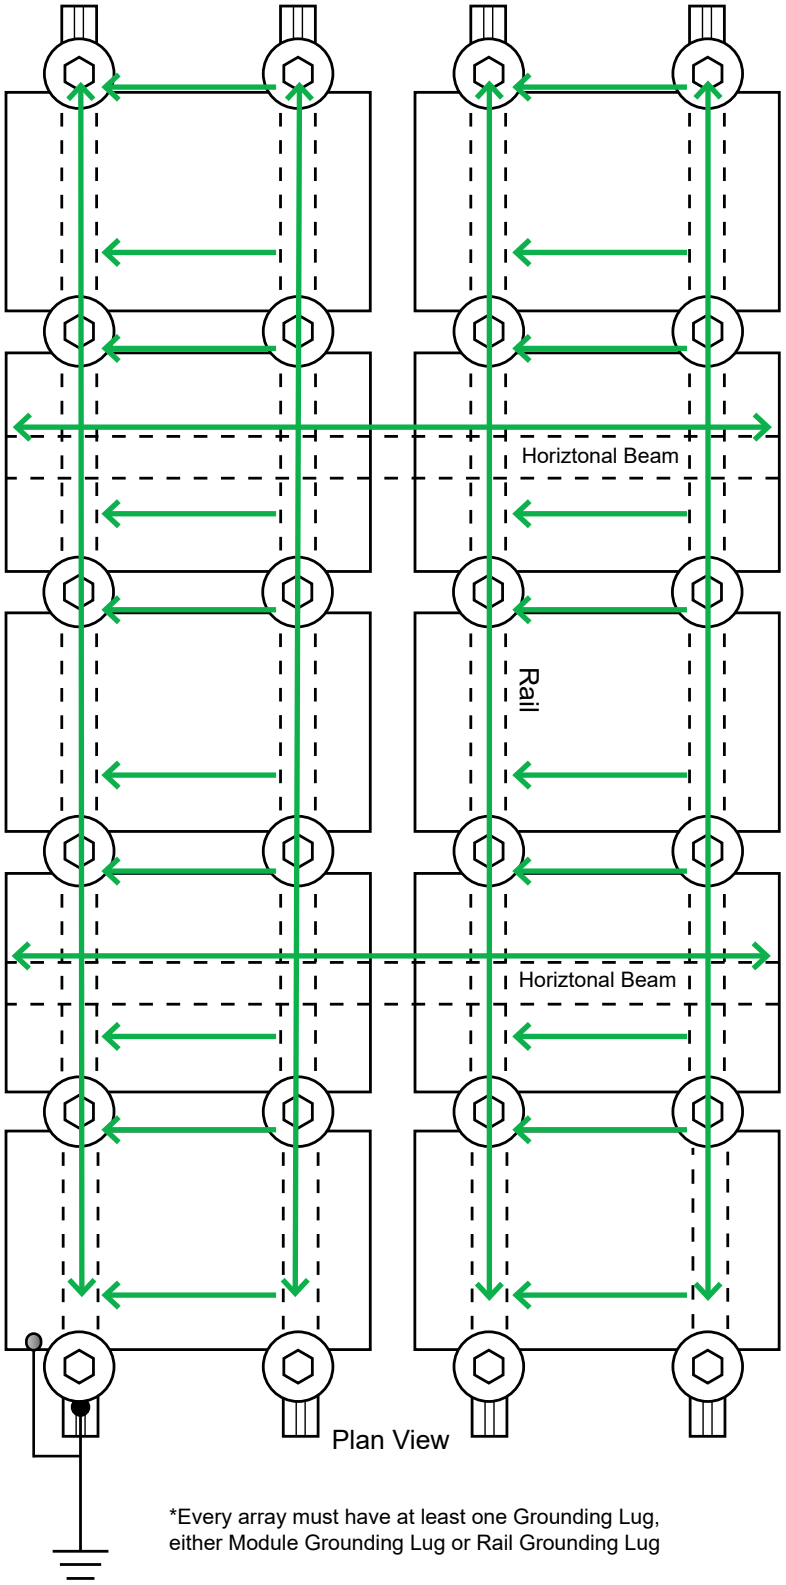

C) Secure the module by tightening the hex bolt with a 7/16" socket to 80 in-lb.

- IR Recommends using a cordless ratchet tool for optimal installation speed
- A ratcheting crescent wrench is also a good option.

Note: Eclipse does not provide electrical bonding for the module. For standalone module installations, the module and rails shall be grounded.

**Cross Braces are optional for concrete foundation systems.

DIAGONAL BRACES (OPTIONAL)

Slide sleeve on north pier 2-3” above the ground (6” max). Attach Diagonal Brace to sleeve with 1/2” hardware.

Slide second sleeve up on south pier 2-3” below top cap (6” max). Raise Diagonal Brace to align holes in sleeve and brace. Attach hardware and raise sleeve to full extent.

Torque Diagonal Brace bolts to **40 ft-lbs**. Torque set screws to **15 ft-lbs**.

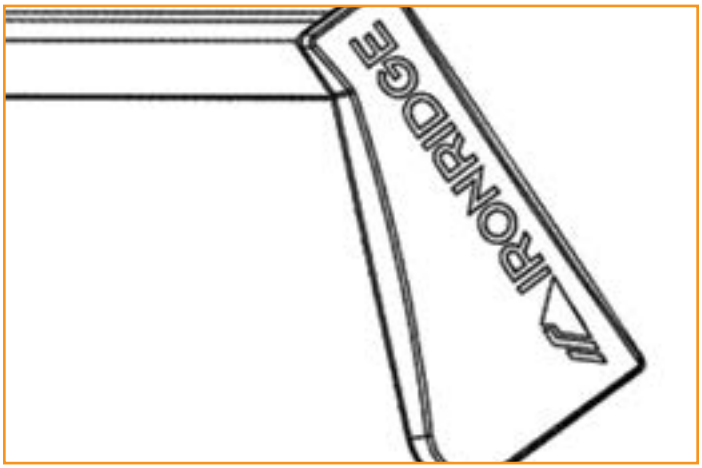

END CAPS

End Caps add a completed look and keep debris and pests from collecting inside rail.

Firmly press End Cap onto rail end.

- **End Caps come in sets of left and right. Check that the proper amount of each has been provided.**
- **For open-structure installations, you can use adhesive to secure the End Caps.**

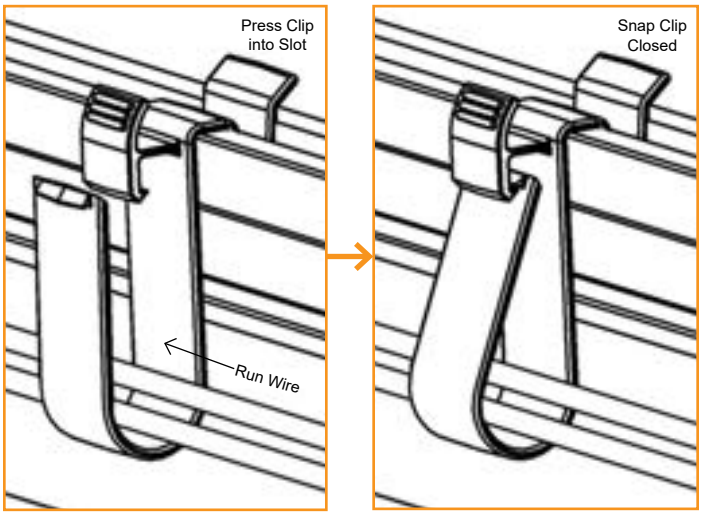

WIRE CLIPS

Wire Clips offer a simple wire management solution.

Firmly press Wire Clip into top rail slot. Open clip and insert electrical wire accordingly. Close clip once complete.

- Wire Clip fits up to quantity 10 - 10 AWG PV Wire or equivalent bundled diameter.

SPLICING CROSS PIPE

The following instructions should be followed, when required, to join more than one section of horizontal beam together to ensure bonding is maintained throughout the system.

A. MECHANICAL TUBING SPLICES

Mechanical tube splices shown in the table below shall be of equivalent Allied Flo-Coat, Allied Gatorshield or Wheatland ThunderCoat coating.

Mechanical Tube Size of the Structure	Splice Tube Size
2.375” OD, 12 Gauge	2.000” OD, 9 Gauge, Minimum 12” Long
3.500” OD, 8 Gauge	3.000” OD, 12 Gauge, Minimum 12” Long

Insert splice tube 6” into first section of cross tube and secure with 2 self-drilling screws (1/4”-14 x ¾”), spacing them approximately 1.25” from end of pipe and approximately 3.50” apart, tightening screws to 9 ft-lbs.

Slide second section of cross tube over splice tube and secure with two more self-drilling screws. Tighten screws to 9 ft-lbs.

- **Pre-drill 5/32” pilot holes through cross tube and splice tube for easier installation of self-drilling screws.**

B. SCHEDULE 40 GRADE B PIPE SPLICES

Use galvanized threaded pipe couplings that match the pipe size used for the structure. Threaded Schedule 40 Grade B Pipe must be used when splicing cross pipe together.

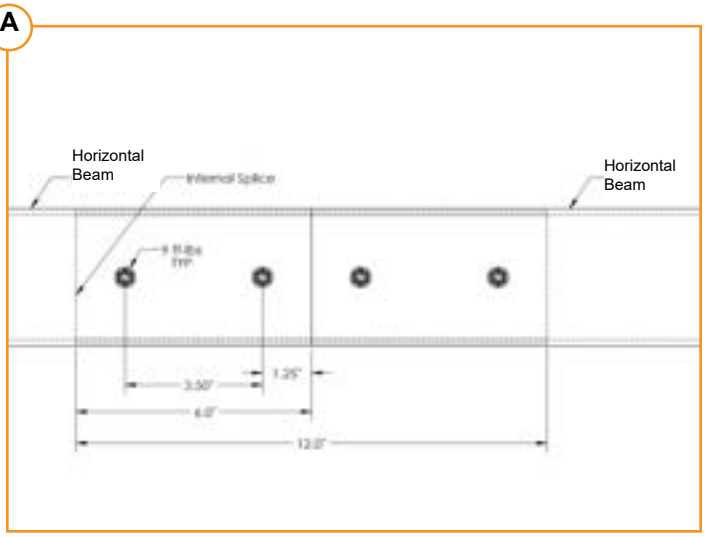

Fully thread coupling onto both sections of pipe being spliced together.

- **Splice cannot be installed in the cantilever, center 1/3 of interior spans, or the outer 2/3 of end spans.**

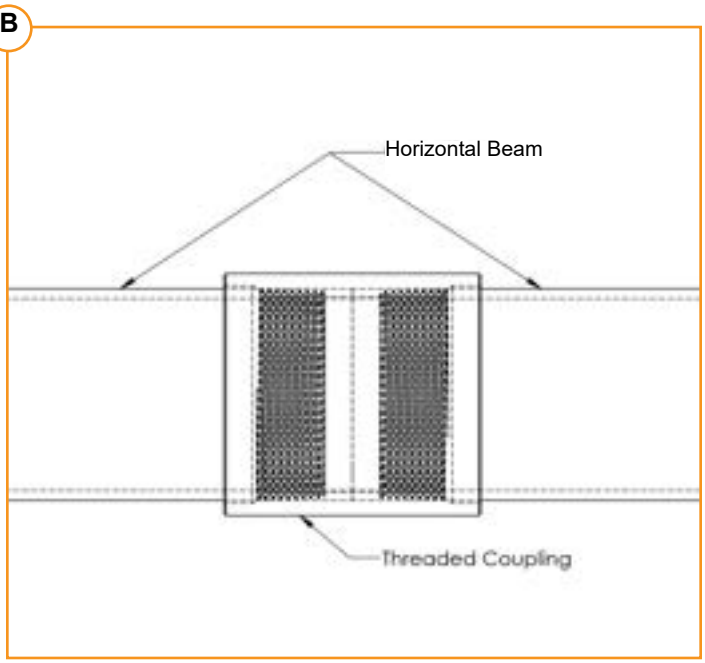

C. HORIZONTAL PIPES CAN BE JOINED OVER AN INTERIOR TOP CAP WITH A MAXIMUM GAP OF 1/2”

- **To avoid potential problems from the effects of thermal expansion, a maximum total continuous cross pipe length of 100 ft is recommended.**
